

How about watering?

Now without obligation
get advice

Status Quo

Clear trend towards more precipitation in winter, but less in summer.

Source: German Weather Service

Economical solution:

**Agricultural Rainwater
Collection,
Agricultural rainwater storage
and efficient irrigation**

with solar power plants!

Rain collection

The green area of a solar power plant has 80% less water demand.

We collect this excess capacity with drainage and make it available for your farm.

From 50 hectares of leased land, a 1 hectare PV water storage tank is included in the project free of charge!

Rain storage

We lease the areas of your water reservoirs and reduce evaporation and algae formation with solar systems.

We offer good conditions for the construction of new storage with integrated sun protection!

Canopies are possible as floating systems or with fixed elevation.

Efficient irrigation and drainage with drainage via tracked Solar systems from Doppelernte

Agro-climate adaptation

The adaptation to the changed climatic conditions can also be solved in an economically attractive way.

We offer projects as our own investment opportunity or free of charge via a lease model for your land.

Please also contact us if you do not farm your own land. Your landlord is also interested in maintaining your production security!
